---

In order to see grizzly bears during your Alaska travel eating salmon at a creek you not only need luck, but also good planning ( [see the grizzly bears](#) ). Proper planning is not only fundamental for many areas of daily life (e.g., when building a house, climbing a mountain or travelling) but is also essential for the success of software projects or business processes.

Recognizing the importance of good planning skills the Alaska Simulator Toolset (AST) has been developed, which allows people to test, analyze and improve their own planning behaviour. In addition, the Alaska simulator can be used to explore alternative planning approaches and to compare their strengths and weaknesses.
